

Every emitting factor in the RoboCOP Fiber-seq model and the mean m6A rate its state uses
12 TFs have a fitted footprint; 141 motifs + the unknown state all share one scalar, combined_low_count

Dotted lines: combined_low_count, the single scalar 142 of the 154 TF states use. Dashed line: background. Lower strip shows each fitted footprint (Watson blue, Crick orange) against those two levels.
The mean is over the footprint's own positions; the decoder mirrors and channel-crosses these vectors for the reverse-strand block (robocop.py:658-659, commit 90b05c3), which leaves the mean unchanged. Values are raw: nothing floors, caps or scales p between the pickle and binom.pmf (robocop.py:801).
